

Project Title:

# **NLP Interview Assessment System (NLPIAS)**

## **Project Overview**

NLPIAS is an **AI and NLP-Based Interview Assessment System** developed to make the recruitment process faster, smarter, and more efficient for IT companies. It automates important hiring tasks such as resume screening, resume-job matching, candidate ranking, interview question generation, and interview evaluation.

The system allows candidates to upload resumes or create professional resumes using the built-in resume builder. Candidates can apply for jobs, practice through mock interviews, and attend AI-based interviews using text or voice responses. Their answers are evaluated using NLP techniques to generate scores, feedback, and performance reports.

For recruiters, NLPIAS provides a dashboard where they can post jobs, view applications, check ranked candidates, send interview invitations, and review AI-generated interview reports. In real interviews, the system also records basic camera monitoring indicators such as camera availability, multiple faces, and attention-related observations as supporting information.

Overall, NLPIAS helps reduce manual screening effort, improve candidate-job matching accuracy, support fairer shortlisting, and provide a complete AI-assisted recruitment experience for both recruiters and candidates.
